

CET333 Additional Guidance Notes

These notes provide additional guidance on creating and submitting your portfolio report.

Note that this is a 'Practitioner Portfolio', not a research document; where narrative or description is needed, this should be written in your own words, and a reference list is not mandatory. However, should you directly or indirectly quote or use other sources, these should be appropriately referenced.

You need to produce all the required elements as outlined in the assessment. You are advised to use the grading criteria to ensure you have included all the required content.

Further guidelines on the content of your portfolio are provided here, including document specifications which you are required to adhere to:

- REQUIREMENTS

The development requires a mandatory statement of the functional and non-functional requirements, a business process model to be supported by the system, and three expected deliverables signed off by your client.

- PROJECT PLANNING

A project schedule should include a timeline and effort allocation for creating the proposed deliverables (software and/or documentation), as well as any revisions to reflect rescheduling if necessary. At this stage, you should include your working schedule, which must outline planned start and end dates, as well as actual start and end dates with clear deliverables. Marks will be deducted if the submitted schedule does not clearly demonstrate that it has been a working document.

- METHODOLOGY

Please make sure to document the methods, tools, and approaches you have incorporated into your project planning to ensure the timely delivery of the specified software product to your client. The report should be written in your own words and does not require academic references. However, you should critically evaluate and discuss the approaches you plan to use.

[As a guide, it should be a maximum of 4 pages long]

- SYSTEM DESIGN DOCUMENTATION

- Prototype: It is strongly recommended that you use a flow diagram or wireframe design of the product that has met the client's needs. Any included diagrams must be original and of high quality.
- Documentation: Provide a brief overview of your application's overall design, development, and architecture. Include images of your final system and a screencast

to demonstrate it (the video demonstration must be submitted using a different link in Canvas).

- TESTING AND EVALUATION

A section on system testing and evaluation, including details on the testing protocol and tools and details of the obtained testing results.

- TECHNICAL DEPLOYMENT OF THE SOLUTION

This section should outline the technical requirements of the system, including a summary of the procedures for installing and deploying the prototype in the production environment. The production environment is where software and other products are put into operation for end users' intended use.

- Examples of some of the issues to consider are:

How will the software be logically packaged? Zip file, JAR file, other?

What media will be used to distribute the software? , website, other?

What kind of licensing or registration is required?

- Technical requirements:

Specify the data platform, hardware, software, programming languages, tools and operating system requirements for the application or project.

- Identify any specialised hardware requirements that were procured or upgraded prior to or in support of the implementation of the application or project.
- Identify any specialised software requirements that were procured or upgraded prior to or in support of the implementation of the application or project.
- Identify the programming languages and tools selected for the development of the application or project.
- Identify the network/operating system or combination of network/operating systems used to develop the application or project.

A technical requirement relates to the technical aspects that your system must fulfil, such as performance-related issues, reliability issues, and availability issues, e.g.,

- CRITICAL REFLECTION

A critical reflection on the entire system development history – appropriate to your programme, including, for example:

- Brief history of the project:

This section is a reflective piece of writing that critically examines the methodologies, approaches, and technologies selected for the project. It should be a structured report based on your own experiences and expressed in your own words. This section does not describe the approaches taken; instead, it should focus on your personal experiences.

- What challenges did you face, and how did you address and overcome them?

Did you need to adapt any methods or approaches to fit the constraints of your project? If so, how did you do this? What aspects of the project went well? What things would you do differently if you did the project again? How have your knowledge and skills progressed? How has doing this project helped you to be more employable when you graduate? Please note that this is not a place to put yourself down, be overly negative, or say how brilliant you are. The aim here should be to provide an honest and balanced account of doing your project within the constraints of a client-driven module.
